

## Care & Maintenance of Stainless Steel

**Our Products:** Our spigots have been tested to ensure they are made from 316 marine grade stainless with a 600 grit mirror finish. The appearance of your stainless steel fittings is kept clean by regular washing and cleaning to remove dirt and grime.

**Cleaning:** Use a soft brush with a mild detergent to clean all your stainless steel fittings (ie: spigots, hinges, latches). Rinse using fresh water to maintain the long term performance of your fittings. A light coating of Lanox will prevent tea staining. Lanox is available from our shop in a 300gm can for \$14.95. Cleaning should start at the time the products are installed.

**Warning:** Be sure not to use the incorrect cleaning product to maintain your stainless steel fittings as the wrong products can be harmful.

**Frequency of Cleaning:** The frequency of such cleaning will depend on many factors including:  
Your geographical location,  
The environment surrounding your location,  
Levels of atmospherical pollution,  
Prevailing wind,  
Protection of your location,  
Possibility of air borne debris.
